- Ease of installation; simple for "do-it-yourselfers"
- Increased protection

Door Tech aluminum storm windows are designed for beauty and engineered for service. Each unit is made from the finest materials and is carefully inspected to ensure perfection and customer satisfaction.

HOWtoMEASURE

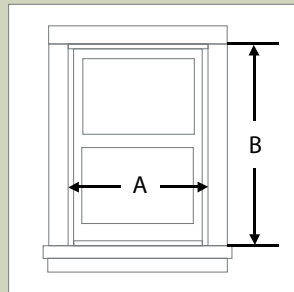

All measurements are taken from the outside and should be the door frame opening.

1. Take three measurements on width (A): top, center, and bottom. Use smallest figure.
2. Measure height (B) from top of opening to sill. Measure both sides and use smallest figure.

When ordering pre-hung doors, face the door from the outside and specify whether hinges are left-hand or right-hand.

Note: Windows should be ordered by frame opening size. Do not make allowances. We will make allowances.

1. Measure opening width (A) at top, center, and bottom of window to be sure opening width is constant. If dimensions are not equal, select either the maximum or a compromise, as part of the storm window fin can be trimmed for a snug fit.

2. Measure opening height (B).

ACCESSDoor

The access door is manufactured with aluminum kick plate material and primarily used as a foundation crawl space door. This unique design may be adapted in a variety of situations and manufactured to most custom size requirements.
